1. will be able to show on the American Chemical Society standardized exam your ability to meet the following learning outcomes:
2. Explain and to predict the effects of substituents on the reactivity and regiochemistry of electrophilic aromatic substitution reactions.
3. Know the structures and chemical properties of carboxylic acid derivatives; be able to write the mechanisms for nucleophilic substitution and hydrolysis reactions of such compounds, and to predict the products of such reactions.
4. Write mechanisms for nucleophilic addition reactions and for addition-elimination reactions of aldehydes and ketones, and be able to predict the products of such reactions.
5. Understand the reason for and the consequences of the acidity of protons alpha to carbonyl groups, be able to write mechanisms for the reactions of enolate anions, and predict the products of such reactions.
6. Write the mechanism for radical reactions of alkanes, and to predict the products of such reactions.
7. Identify aromatic and antiaromatic compounds and appreciate the chemical consequences of aromaticity; be able to write the mechanisms for and predict the products of electrophilic aromatic substitution reactions.
